## **Multiply Fractions**

$$\frac{3}{8} \times \frac{4}{9}$$

**EXAMPLE** 
$$\frac{3}{8} \times \frac{4}{9}$$
  $\frac{3}{8} \times \frac{4}{9} = \frac{\cancel{3}}{\cancel{8}} \times \cancel{\cancel{9}}_{\cancel{3}}$  Divide by the common factors.

Simplify.

Multiply. Write the product in simplest form.

1. 
$$\frac{9}{14} \times \frac{7}{6}$$

**1.** 
$$\frac{9}{14} \times \frac{7}{6}$$
 **2.**  $\frac{3}{5} \times \frac{4}{7}$  **3.**  $\frac{11}{8} \times \frac{10}{33}$  **4.**  $\frac{4}{9} \times 3$  **.**

3. 
$$\frac{11}{8} \times \frac{10}{33}$$

**4.** 
$$\frac{4}{9} \times 3$$
 \_\_\_\_\_

## **Operations with Fractions**

**EXAMPLE** 
$$\frac{2}{5} \div \frac{7}{10} = \frac{2}{5} \times \frac{10}{7}$$

Multiply by the reciprocal of the divisor.

$$=\frac{2}{5}\times\frac{210}{7}$$

 $=\frac{2}{5}$  ×  $\frac{210}{7}$  Divide by the common factors.

$$=\frac{4}{7}$$

Simplify.

Divide.

5. 
$$\frac{1}{2} \div \frac{1}{4}$$
 \_\_\_\_\_

**5.** 
$$\frac{1}{2} \div \frac{1}{4}$$
 **6.**  $\frac{3}{8} \div \frac{13}{16}$  **7.**  $\frac{2}{5} \div \frac{14}{15}$  **8.**  $\frac{4}{9} \div \frac{16}{27}$  \_\_\_\_\_

**7.** 
$$\frac{2}{5} \div \frac{14}{15}$$
 \_\_\_\_\_

**8.** 
$$\frac{4}{9} \div \frac{16}{27}$$
 \_\_\_\_\_

**9.** 
$$\frac{3}{5} \div \frac{5}{6}$$
 \_\_\_\_\_

**9.** 
$$\frac{3}{5} \div \frac{5}{6}$$
 \_\_\_\_\_ **10.**  $\frac{1}{4} \div \frac{23}{24}$  \_\_\_\_ **11.**  $6 \div \frac{3}{5}$  \_\_\_\_ **12.**  $\frac{4}{5} \div 10$  \_\_\_\_

1. 
$$6 \div \frac{3}{5}$$
 \_\_\_\_\_

**12.** 
$$\frac{4}{5} \div 10$$
 \_\_\_\_

# **Order of Operations**

$$50 - 3(3 + 1)^2$$

$$50 - 3(4)^2$$

To evaluate, first operate within parentheses.

Next simplify exponents.

Then multiply and divide from left to right.

Finally add and subtract from left to right.

#### **Evaluate each expression.**

**13.** 
$$21-6 \div 3$$
 \_\_\_\_ **14.**  $18+(7-4)\times 3$  \_\_\_\_ **15.**  $5+(8-3)^2$  \_\_\_\_

**15.** 
$$5 + (8 - 3)^2$$

**16.** 
$$9 + 18 \div 3 + 10$$
 \_\_\_\_ **17.**  $60 - (3 - 1)^4 \times 3$  \_\_\_\_ **18.**  $10 - 16 \div 4 \times 2 + 6$  \_\_\_\_

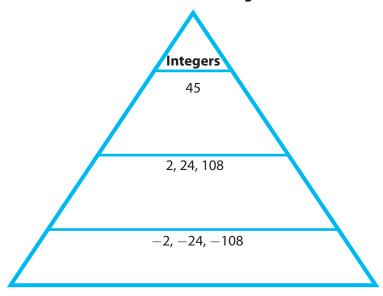

**18.** 
$$10 - 16 \div 4 \times 2 + 6$$

# **Reading** Start-Up

## **Visualize Vocabulary**

Use the 

✓ words to complete the graphic. You can put more than one word in each section of the triangle.

### Vocabulary

#### **Review Words**

integers (enteros)

- ✓ negative numbers (números negativos) pattern (patrón)
- ✓ positive numbers (números positivos)
- ✓ whole numbers (números enteros)

#### **Preview Words**

additive inverse (inverso aditivo)

opposite *(opuesto)* 

rational number (número racional)

repeating decimal (decimal periódico)

terminating decimal (decimal finito)

## **Understand Vocabulary**

Complete the sentences using the preview words.

1. A decimal number for which the decimals come to an end is a

\_\_\_\_\_ decimal.

2. The \_\_\_\_\_\_, or \_\_\_\_\_, of a number is the same distance from 0 on a number line as the original number, but on the other side of 0.

# **Active Reading**

Layered Book Before beginning the module, create a layered book to help you learn the concepts in this module. At the top of the first flap, write the title of the module, "Rational Numbers." Label the other flaps "Adding," "Subtracting," "Multiplying," and "Dividing." As you study each lesson, write important ideas, such as vocabulary and processes, on the appropriate flap.

**GETTING READY FOR** 

# **Rational Numbers**

Understanding the Standards and the vocabulary terms in the Standards will help you know exactly what you are expected to learn in this module.

Solve real-world and mathematical problems involving the four operations with rational numbers.

#### **Key Vocabulary**

rational number (número

racional)

Any number that can be expressed as a ratio of two integers.

### What It Means to You

You will add, subtract, multiply, and divide rational numbers.

#### **EXAMPLE 7.NS.3**

$$-15 \cdot \frac{2}{3} - 12 \div 1\frac{1}{3}$$

$$-\frac{15}{1} \cdot \frac{2}{3} - \frac{12}{1} \div \frac{4}{3}$$

$$-\frac{15}{1} \cdot \frac{2}{3} - \frac{12}{1} \cdot \frac{3}{4}$$

$$-\frac{15}{1} \cdot \frac{2}{3} - \frac{12}{1} \cdot \frac{3}{4}$$

$$-\frac{15}{1} \cdot \frac{2}{3} - \frac{12^{3} \cdot 3}{1 \cdot 4}$$

$$-\frac{10}{1} - \frac{9}{1} = -10 - 9 = -19$$

Write as fractions.

To divide, multiply by the reciprocal.

Simplify.

Multiply.

### CACC 7.NS.3

Solve real-world and mathematical problems involving the four operations with rational numbers.

## What It Means to You

You will solve real-world and mathematical problems involving the four operations with rational numbers.

#### **EXAMPLE 7.NS.3**

In 1954, the Sunshine Skyway Bridge toll for a car was \$1.75. In 2012, the toll was  $\frac{5}{7}$  of the toll in 1954. What was the toll in 2012?

$$1.75 \cdot \frac{5}{7} = 1\frac{3}{4} \cdot \frac{5}{7}$$
 Write the decimal as a fraction. 
$$= \frac{7}{4} \cdot \frac{5}{7}$$
 Write the mixed number as an improper fraction. 
$$= \frac{\cancel{7} \cdot 5}{\cancel{4} \cdot \cancel{7}_{1}}$$
 Simplify. 
$$= \frac{5}{4} = 1.25$$
 Multiply, then write as a decimal.

The Sunshine Skyway Bridge toll for a car was \$1.25 in 2012.

Visit my.hrw.com to see all CA Common Core Standards explained.

# **LESSON** Rational Numbers and Decimals

CACC 7.NS.2d

Convert a rational number to a decimal using long division; know that the decimal form of a rational number terminates in 0s or eventually repeats. Also 7.NS.2b

How can you convert a rational number to a decimal?

#### **EXPLORE ACTIVITY**

# **Describing Decimal Forms** of Rational Numbers

A rational number is a number that can be written as a ratio of two integers a and b, where b is not zero. For example,  $\frac{4}{7}$  is a rational number, as is 0.37 because it can be written as the fraction  $\frac{37}{100}$ .

A Use a calculator to find the equivalent decimal form of each fraction. Remember that numbers that repeat can be written as 0.333... or  $0.\overline{3}$ .

Fraction	<u>1</u>	<u>5</u> 8	<u>2</u> 3	<u>2</u> 9	<u>12</u> 5		
Decimal Equivalent						0.2	0.875

- **B** Now find the corresponding fraction of the decimal equivalents given in the last two columns in the table. Write the fractions in simplest form.
- Conjecture What do you notice about the digits after the decimal point in the decimal forms of the fractions? Compare notes with your neighbor and refine your conjecture if necessary.

#### Reflect

- 1. Consider the decimal 0.101001000100001000001.... Do you think this decimal represents a rational number? Why or why not?
- Do you think a negative sign affects whether or not a number is a rational number? Use  $-\frac{8}{5}$  as an example.

O Houghton Mifflin Harcourt Publishing Company

#### **EXPLORE ACTIVITY** (cont'd)

**3.** Do you think a mixed number is a rational number? Explain.

# **Writing Rational Numbers as Decimals**

You can convert a rational number to a decimal using long division. Some decimals are **terminating decimals** because the decimals come to an end. Other decimals are **repeating decimals** because one or more digits repeat infinitely.

#### **EXAMPLE 1**

CACC 7.NS.2d

Write each rational number as a decimal.

$$-\frac{5}{16}$$

Divide 5 by 16.

Add a zero after the decimal point.

Subtract 48 from 50.

Use the grid to help you complete the long division.

Add zeros in the dividend and continue dividing until the remainder is 0.

The decimal equivalent of  $-\frac{5}{16}$  is -0.3125.

Divide 13 by 33.

Add a zero after the decimal point. Subtract 99 from 130.

Use the grid to help you complete the long division.

You can stop dividing once you discover a repeating pattern in the quotient.

Write the quotient with its repeating pattern and indicate that the repeating numbers continue.

The decimal equivalent of  $\frac{13}{33}$  is 0.3939..., or  $0.\overline{39}$ .

		0.	3	1	2	5	
1	6)	5.	0	0	0	0	
	_	4	8				
			2	0			
		_	1	6			
				4	0		
			_	3	2		
					8	0	
				_	8	0	
						0	

Do you think that decimals that have repeating patterns always have the same number of digits in their pattern? Explain.

			0.	3	9	3	9	
3	3	1	3.	0	0	0	0	-
		_	9	9				
			3	1	0			
		_	2	9	7			
				1	3	0		
				_	9	9		
					3	1	0	
				_	2	9	7	
						1	3	

Write each rational number as a decimal.

- **4.**  $-\frac{4}{7}$  **5.**  $\frac{1}{3}$  **6.**  $-\frac{9}{20}$

My Notes

# **Writing Mixed Numbers as Decimals**

You can convert a mixed number to a decimal by rewriting the fractional part of the number as a decimal.

### **EXAMPLE 2**

**CA CC** 7.NS.2d

Shawn rode his bike  $6\frac{3}{4}$  miles to the science museum. Write  $6\frac{3}{4}$  as a decimal.

STEP 1

Rewrite the fractional part of the number as a decimal.

$$\begin{array}{r}
0.75 \\
4)3.00 \\
-\underline{28} \\
20 \\
\underline{-20} \\
0
\end{array}$$

Divide the numerator by the denominator.

STEP 2

Rewrite the mixed number as the sum of the whole part and the decimal part.

$$6\frac{3}{4} = 6 + \frac{3}{4}$$
$$= 6 + 0.75 = 6.75$$

# YOUR TURN

- The change (\$) in a stock value was  $-2\frac{3}{4}$  per share. Write  $-2\frac{3}{4}$  as a decimal.  $-2\frac{3}{4} =$ \_\_\_\_\_ Is the decimal equivalent a terminating or repeating decimal?
- **8.** Yvonne bought a watermelon that weighed  $7\frac{1}{3}$  pounds. Write  $7\frac{1}{3}$  as a decimal.  $7\frac{1}{3} =$ \_\_\_\_\_\_ Is the decimal equivalent a terminating or repeating decimal?

### **Guided Practice**

Write each rational number as a decimal. Then tell whether each decimal is a terminating or a repeating decimal. (Explore Activity and Example 1)

1. 
$$\frac{3}{5} =$$

**1.** 
$$\frac{3}{5} =$$
 \_\_\_\_\_\_ **2.**  $-\frac{89}{100} =$  \_\_\_\_\_ **3.**  $\frac{4}{12} =$  \_\_\_\_\_\_

26.	<b>Vocabulary</b> A rational number can be written as the ratio of one	
	to another and can be represented by a repeating	
	or decimal.	
27.	<b>Problem Solving</b> Marcus is $5\frac{7}{24}$ feet tall. Ben is $5\frac{5}{16}$ feet tall. Which of the two boys is taller? Justify your answer.	
28.	<b>Represent Real-World Problems</b> If one store is selling $\frac{3}{4}$ of a bushel of apples for \$9, and another store is selling $\frac{2}{3}$ of a bushel of apples for \$9, which store has the better deal? Explain your answer.	
H.	FOCUS ON HIGHER ORDER THINKING	Work Area
29.	Analyze Relationships You are given a fraction in simplest form. The numerator is not zero. When you write the fraction as a decimal, it is a repeating decimal. Which numbers from 1 to 10 could be the denominator?	
30.	<b>Communicate Mathematical Ideas</b> Julie got 21 of the 23 questions on her math test correct. She got 29 of the 32 questions on her science test correct. On which test did she get a higher score? Can you compare the fractions $\frac{21}{23}$ and $\frac{29}{32}$ by comparing 29 and 21? Explain. How can Julie compare her scores?	
31.	<b>Look for a Pattern</b> Look at the decimal 0.121122111222 If the pattern continues, is this a repeating decimal? Explain.	

# 3.2 Adding Rational Numbers

CACC 7.NS.1d

Apply properties of operations as strategies to add and subtract rational numbers. Also 7.NS.1a, 7.NS.1b, 7.NS.3

How can you add rational numbers?

# Adding Rational Numbers with the Same Sign

To add rational numbers with the same sign, apply the rules for adding integers. The sum has the same sign as the sign of the rational numbers.

#### **EXAMPLE 1**

A Malachi hikes for 2.5 miles and stops for lunch. Then he hikes for 1.5 more miles. How many miles did he hike altogether?

**STEP 1** Use positive numbers to represent the distance Malachi hiked.

**STEP 2** Find 2.5 + 1.5.

STEP 4 Move 1.5 units to the *right* because the

second addend is *positive*.

The result is 4.

Malachi hiked 4 miles.

B Kyle pours out  $\frac{3}{4}$  liter of liquid from a beaker. Then he pours out another  $\frac{1}{2}$  liter of liquid. What is the overall change in the amount of liquid in the beaker?

Use negative numbers to represent amounts the change each time Kyle pours liquid from the beaker.

**STEP 2** Find  $-\frac{3}{4} + \left(-\frac{1}{2}\right)$ .

STEP 4 Move  $\left|-\frac{1}{2}\right| = \frac{1}{2}$  unit to the *left* because the second addend is *negative*.

The result is  $-1\frac{1}{4}$ .

The amount of liquid in the beaker has decreased by  $1\frac{1}{4}$  liters.

#### Reflect

Explain how to determine whether to move right or left on the number line when adding rational numbers.

# YOUR TURN

Use a number line to find each sum.

**2.** 
$$3+1\frac{1}{2}=$$

**3.** 
$$-2.5 + (-4.5) =$$

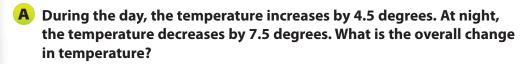

# **Adding Rational Numbers with Different Signs**

To add rational numbers with different signs, find the difference of their absolute values. Then use the sign of the rational number with the greater absolute value.

#### **EXAMPLE 2**

Use a positive number to represent the increase in temperature and a negative number to represent a decrease in temperature.

Find 4.5 + (-7.5).

Move |-7.5| = 7.5 units to the *left* because the second addend is negative.

The result is -3.

The temperature decreased by 3 degrees overall.

B Ernesto writes a check for \$2.50. Then he deposits \$6 in his checking account. What is the overall increase or decrease in the account balance?

number to represent a withdrawal or a check.

STEP 2 Find -2.5 + 6.

STEP 1

My Notes

STEP 3 Start at -2.5.

- STEP 4 Move |6| = 6 units to the *right* because the second addend is positive.

Use a positive number to represent a deposit and a negative

The result is 3.5.

#### Reflect

**4.** Do -3 + 2 and 2 + (-3) have the same sum? Does it matter if the negative number is the first addend or the second addend?

The account balance will increase by \$3.50.

**5.** Make a Conjecture Do you think the sum of a negative number and a positive number will always be negative? Explain your reasoning.

# YOUR TURN

Use a number line to find each sum.

**6.** 
$$-8+5=$$

**7.** 
$$\frac{1}{2} + \left(-\frac{3}{4}\right) = \underline{\hspace{1cm}}$$

**Mathematical Practices** 

Explain how to use a number line to find

the additive inverse, or opposite, of -3.5.

My Notes

# **Finding the Additive Inverse**

The opposite, or additive inverse, of a number is the same distance from 0 on a number line as the original number, but on the other side of 0. Zero is its own additive inverse.

#### **EXAMPLE 3**

A football team loses 3.5 yards on their first play. On the next play, they gain 3.5 yards. What is the overall increase or decrease in yards?

STEP 1

Use a positive number to represent the gain in yards and a negative number to represent the loss in yards.

STEP 2

Find -3.5 + 3.5.

STEP 3

Start at -3.5.

STEP 4

Move |3.5| = 3.5 units to the *right*, because the second addend is positive.

The result is 0. This means the overall change is 0 yards.

#### Addition Property of Opposites

The sum of a number and its opposite, or additive inverse, is 0. This can be written as p + (-p) = 0.

# YOUR TURN

Use a number line to find each sum.

**9.** 
$$2\frac{1}{2} + \left(-2\frac{1}{2}\right) = \underline{\hspace{1cm}}$$
 **10.**  $-4.5 + 4.5 = \underline{\hspace{1cm}}$ 

**10.** 
$$-4.5 + 4.5 =$$
 \_\_\_\_\_

# **Adding Three or More Rational Numbers**

Recall that the Associative Property of Addition states that if you are adding more than two numbers, you can group any of the numbers together. This property can help you add numbers with different signs.

## **EXAMPLE 4**

CACC 7.NS.1d, 7.NS.3

Tina spent \$5.25 on craft supplies to make friendship bracelets. She made \$6.75 and spent an additional \$3.25 for supplies on Monday. On Tuesday, she sold an additional \$4.50 worth of bracelets. What was Tina's overall profit or loss?

Use *negative* numbers to represent the amount Tina spent and positive numbers to represent the money Tina earned.

Profit means the difference between income and costs is positive.

STEP 2

Find 
$$-5.25 + 6.75 + (-3.25) + 4.50$$
.

Group numbers with the same sign.

$$-5.25 + (-3.25) + 6.75 + 4.50$$
 Commutative Property

$$(-5.25 + (-3.25)) + (6.75 + 4.50)$$
 Associative Property

$$-8.50 + 11.25$$

Add the numbers inside the parentheses.

Find the difference of the absolute

values: 11.25 - 8.50

2.75

Use the sign of the number with the greater absolute value. The sum is positive.

Tina earned a profit of \$2.75.

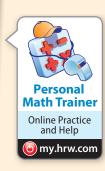

Find each sum.

**12.** 
$$-1.5 + 3.5 + 2 =$$

**13.** 
$$3\frac{1}{4} + (-2) + \left(-2\frac{1}{4}\right) =$$
 \_\_\_\_\_

**14.** 
$$-2.75 + (-3.25) + 5 =$$

## **Guided Practice**

Use a number line to find each sum. (Example 1 and Example 2)

**1.** -3 + (-1.5) =

3. 
$$\frac{1}{4} + \frac{1}{2} =$$

**3.** 
$$\frac{1}{4} + \frac{1}{2} =$$
 **4.**  $-1\frac{1}{2} + \left(-1\frac{1}{2}\right) =$  \_\_\_\_\_

**6.** 
$$-1.5 + 4 =$$

- 7. Victor borrowed \$21.50 from his mother to go to the theater. A week later, he paid her \$21.50 back. How much does he still owe her? (Example 3)
- **8.** Sandra used her debit card to buy lunch for \$8.74 on Monday. On Tuesday, she deposited \$8.74 back into her account. What is the overall increase or decrease in her bank account? (Example 3)

Find each sum without using a number line. (Example 4)

**9.** 
$$2.75 + (-2) + (-5.25) =$$

**9.** 
$$2.75 + (-2) + (-5.25) =$$
 **10.**  $-3 + (1\frac{1}{2}) + (2\frac{1}{2}) =$ 

**13.** 
$$4.5 + (-12) + (-4.5) =$$

**14.** 
$$\frac{1}{4} + \left(-\frac{3}{4}\right) = \underline{\hspace{1cm}}$$

**15.** 
$$-4\frac{1}{2}+2=$$

**15.** 
$$-4\frac{1}{2}+2=$$
 \_\_\_\_\_\_\_ **16.**  $-8+\left(-1\frac{1}{8}\right)=$  \_\_\_\_\_\_

# ESSENTIAL QUESTION CHECK-IN

**17.** How can you use a number line to find the sum of -4 and 6?

# 3.2 Independent Practice

- **18.** Samuel walks forward 19 steps. He represents this movement with a positive 19. How would he represent the opposite of this number?
- **19.** Julia spends \$2.25 on gas for her lawn mower. She earns \$15.00 mowing her neighbor's yard. What is Julia's profit?
- **20.** A submarine submerged at a depth of -35.25 meters dives an additional 8.5 meters. What is the new depth of the submarine?
- **21.** Renee hiked for  $4\frac{3}{4}$  miles. After resting, Renee hiked back along the same route for  $3\frac{1}{4}$  miles. How many more miles does Renee need to hike to return to the place where she started?
- **22. Geography** The average elevation of the city of New Orleans, Louisiana, is 0.5 m below sea level. The highest point in Louisiana is Driskill Mountain at about 163.5 m higher than New Orleans. How high is Driskill Mountain?
- **23. Problem Solving** A contestant on a game show has 30 points. She answers a question correctly to win 15 points. Then she answers a question incorrectly and loses 25 points. What is the contestant's final score?

Financial Literacy Use the table for 24–26. Kameh owns a bakery. He recorded the bakery income and expenses in a table.

- **24.** In which months were the expenses greater than the income? Name the month and find how much money was lost.
- **25.** In which months was the income greater than the expenses? Name the months and find how much money was gained.

Month	Income (\$)	Expenses (\$)
January	1,205	1,290.60
February	1,183	1,345.44
March	1,664	1,664.00
June	2,413	2,106.23

**26.** Communicate Mathematical Ideas If the bakery started with an extra \$250 from the profits in December, describe how to use the information in the table to figure out the profit or loss of money at the bakery by the end of August. Then calculate the profit or loss.

Houghton Mifflin Harcourt Publishing Company

- **27. Vocabulary** –2 is the \_\_\_\_\_ of 2.
- 28. The basketball coach made up a game to play where each player takes 10 shots at the basket. For every basket made, the player gains 10 points. For every basket missed, the player loses 15 points.
  - a. The player with the highest score sank 7 baskets and missed 3. What was the highest score?
  - **b.** The player with the lowest score sank 2 baskets and missed 8. What was the lowest score?
  - **c.** Write an expression using addition to find out what the score would be if a player sank 5 baskets and missed 5 baskets.

#### FOCUS ON HIGHER ORDER THINKING

29. Communicate Mathematical Ideas Explain the different ways it is possible to add two rational numbers and get a negative number.

- **30.** Explain the Error A student evaluated -4 + x for  $x = -9\frac{1}{2}$  and got an answer of  $5\frac{1}{2}$ . What might the student have done wrong?
- **31. Draw Conclusions** Can you find the sum [5.5 + (-2.3)] + (-5.5 + 2.3)without performing any additions? Explain.

O Houghton Mifflin Harcourt Publishing Company

Work Area

# 3.3 Subtracting Rational Numbers

Understand subtraction of rational numbers as adding the additive inverse, p-q=p+(-q). Show that the distance between two rational numbers on the number line is the absolute value of their difference, and apply this principle in real-world contexts. Also 7.NS.1

How do you subtract rational numbers?

# **Subtracting Positive Rational Numbers**

To subtract rational numbers, you can apply the same rules you use to subtract integers.

#### **EXAMPLE 1**

CACC 7.NS.1

The temperature on an outdoor thermometer on Monday was 5.5  $^{\circ}$ C. The temperature on Thursday was 7.25 degrees less than the temperature on Monday. What was the temperature on Thursday?

Subtract to find the temperature on Thursday.

Find 5.5 - 7.25.

#### STEP 2

Start at 5.5.

Move |7.25| = 7.25 units to the *left* because you are subtracting a positive number.

The result is -1.75.

The temperature on Thursday was -1.75 °C.

# YOUR TURN

Use a number line to find each difference.

2. 
$$1\frac{1}{2} - 2 =$$
  $-1$  0 1 2 3 4

# **Subtracting Negative Rational Numbers**

To subtract negative rational numbers, move in the opposite direction on the number line.

#### **EXAMPLE 2**

**CA CC** 7.NS.1

During the hottest week of the summer, the water level of the Muskrat River was  $\frac{5}{6}$  foot below normal. The following week, the level was  $\frac{1}{3}$  foot below normal. What is the overall change in the water level?

Subtract to find the difference in water levels.

**STEP 1** Find 
$$-\frac{1}{3} - (-\frac{5}{6})$$
.

**STEP 3** Move  $\left|-\frac{5}{6}\right| = \frac{5}{6}$  to the *right* because you are subtracting a *negative* number.

The result is  $\frac{1}{2}$ .

So, the water level changed  $\frac{1}{2}$  foot.

#### Reflect

- **4.** Work with other students to compare addition of negative numbers on a number line to subtraction of negative numbers on a number line.
- **5.** Compare the methods used to solve Example 1 and Example 2.

# YOUR TURN

**7.** 
$$-\frac{1}{2} - \left(-\frac{3}{4}\right) =$$

my.hrw.com

**Math Trainer** Online Practice

# EXPLORE ACTIVITY 1 Regi

# **Adding the Opposite**

Joe is diving  $2\frac{1}{2}$  feet below sea level. He decides to descend  $7\frac{1}{2}$  more feet. How many feet below sea level is he?

STEP 1

Use negative numbers to represent the number of feet below sea level.

**STEP 2** Find 
$$-2\frac{1}{2} - 7\frac{1}{2}$$
.

Start at 
$$-2\frac{1}{3}$$
.

STEP 4 Move 
$$\left|7\frac{1}{2}\right| = 7\frac{1}{2}$$
 units to the \_\_\_\_\_

because you are subtracting a \_\_\_\_\_\_ number.

The result is -10.

Joe is \_\_\_\_\_\_ sea level.

You move left on a number line to add a negative number. You move the same direction to subtract a positive number.

#### Reflect

**8.** Compare the difference -3.5 - 5.8 to the sum -3.5 + (-5.8).

**9.** Analyze Relationships Work with other students to explain how to change a subtraction problem into an addition problem.

Adding the Opposite

To subtract a number, add its opposite. This can also be written as p - q = p + (-q).

# EXPLORE ACTIVITY 2 Red World

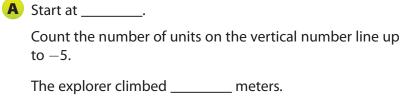

# **Finding the Distance between Two Numbers**

A cave explorer climbed from an elevation of -11 meters to an elevation of -5 meters. What vertical distance did the explorer climb?

There are two ways to find the vertical distance.

This means that the vertical distance between -11 meters and -5 meters is \_\_\_\_\_ meters.

$$-11 - (-5) =$$

Take the absolute value of the difference because distance traveled is always a nonnegative number.

The vertical distance is \_\_\_\_\_meters.

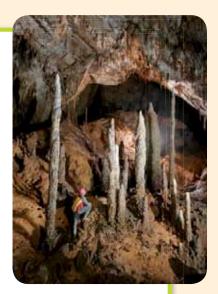

#### Reflect

- **10.** Does it matter which way you subtract the values when finding distance? Explain.
- **11.** Would the same methods work if both the numbers were positive? What if one of the numbers were positive and the other negative?

The distance between two values a and b on a number line is represented by the absolute value of the difference of a and b.

Distance between a and b = |a - b| or |b - a|.

- **14.** Eleni withdrew \$45.00 from her savings account. She then used her debit card to buy groceries for \$30.15. What was the total amount Eleni took out of her account? (Explore Activity 1)

# **ESSENTIAL QUESTION CHECK-IN**

**15.** Mandy is trying to subtract 4 - 12, and she has asked you for help. How would you explain the process of solving the problem to Mandy, using a number line?

# 3.3 Independent Practice

- **16. Science** At the beginning of a laboratory experiment, the temperature of a substance is -12.6 °C. During the experiment, the temperature of the substance decreases 7.5 °C. What is the final temperature of the substance?
- **17.** A diver went 25.65 feet below the surface of the ocean, and then 16.5 feet further down, he then rose 12.45 feet. Write and solve an expression to find the diver's new depth.

#### Astronomy Use the table for problems 18-19.

**18.** How much deeper is the deepest canyon on Mars than the deepest canyon on Venus?

Elevations on Planets				
Lowest (ft) Highest (ft)				
Earth	-36,198	29,035		
Mars	-26,000	70,000		
Venus	-9,500	35,000		

- **19.** Persevere in Problem Solving What is the difference between Earth's highest mountain and its deepest ocean canyon? What is the difference between Mars' highest mountain and its deepest canyon? Which difference is greater? How much greater is it?
- **20.** A city known for its temperature extremes started the day at -5 degrees Fahrenheit. The temperature increased by 78 degrees Fahrenheit by midday, and then dropped 32 degrees by nightfall.
  - **a.** What expression can you write to find the temperature at nightfall?
  - **b.** What expression can you write to describe the overall change in temperature? *Hint*: Do not include the temperature at the beginning of the day since you only want to know about how much the temperature changed.
  - **c.** What is the final temperature at nightfall? What is the overall change in temperature?

21.		nancial Literacy On Monday, your bank account balance was —\$12.58. cause you didn't realize this, you wrote a check for \$30.72 for groceries.	
	a.	What is the new balance in your checking account?	
	b.	The bank charges a \$25 fee for paying a check on a negative balance. What is the balance in your checking account after this fee?	
	c.	How much money do you need to deposit to bring your account balance back up to \$0 after the fee?	
22.		mela wants to make some friendship bracelets for her friends. Each endship bracelet needs 5.2 inches of string.	
	a.	If Pamela has 20 inches of string, does she have enough to make bracelets for 4 of her friends?	
	b.	If so, how much string would she had left over? If not, how much more string would she need?	
23.	for	remy is practicing some tricks on his skateboard. One trick takes him ward 5 feet, then he flips around and moves backwards 7.2 feet, then moves forward again for 2.2 feet.	
	а.	What expression could be used to find how far Jeremy is from his starting position when he finishes the trick?	
	b.	How far from his starting point is he when he finishes the trick? Explain.	
24.	to l	teban has \$20 from his allowance. There is a comic book he wishes buy that costs \$4.25, a cereal bar that costs \$0.89, and a small remote ntrol car that costs \$10.99.	
	a.	Does Esteban have enough to buy everything?	
	b.	If so, how much will he have left over? If not, how much does he still need?	

# FOCUS ON HIGHER ORDER THINKING

to simplify the evaluation of the expression  $-\frac{7}{16} - \frac{1}{4} - \frac{5}{16}$ .

25. Look for a Pattern Show how you could use the Commutative Property

**26. Problem Solving** The temperatures for five days in Kaktovik, Alaska, are given below.

Temperatures for the following week are expected to be approximately twelve degrees lower each day than the given temperatures. What are the highest and lowest temperatures expected for the corresponding 5 days next week?

**27.** Make a Conjecture Must the difference between two rational numbers be a rational number? Explain.

**28.** Look for a Pattern Evan said that the difference between two negative numbers must be negative. Was he right? Use examples to illustrate your answer.

# 3.4 Numbers

Apply and extend previous understandings of multiplication and division and of fractions to multiply and divide rational numbers. Also 7.NS.2a, 7.NS.2c

How do you multiply rational numbers?

# **Multiplying Rational Numbers** with Different Signs

The rules for the signs of products of rational numbers with different signs are summarized below. Let p and q be rational numbers.

Products of Rational Numbers					
Sign of Factor <i>p</i>	Sign of Factor <i>q</i>	Sign of Product pq			
+	_	_			
_	+	_			

You can also use the fact that multiplication is repeated addition.

#### **EXAMPLE 1**

Gina hiked down a canyon and stopped each time she descended mile to rest. She hiked a total of 4 sections. What is her overall change in elevation?

STEP 1 Use a negative number to represent the change in elevation.

Start at 0. Move  $\frac{1}{2}$  unit to the left 4 times. STEP 3

> The result is -2. The overall change is -2 miles. -3

Use the rules for multiplying rational numbers.

$$4\left(-\frac{1}{2}\right) = \left(-\frac{4}{2}\right)$$
 A negative times a positive equals a negative.  
=  $-2$  Simplify.

# YOUR TURN

Use a number line to find 2(-3.5).

# **Multiplying Rational Numbers** with the Same Sign

The rules for the signs of products with the same signs are summarized below.

Products of Rational Numbers					
Sign of Factor <i>p</i>	Sign of Factor q	Sign of Product pq			
+	+	+			
_	_	+			

You can also use a number line to find the product of rational numbers with the same signs.

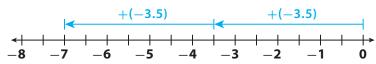

My Notes

#### **EXAMPLE 2**

CACC 7.NS.2, 7.NS.2a

Multiply -2(-3.5).

STEP 1 First, find the product 2(-3.5).

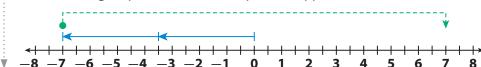

STEP 2 Start at 0. Move 3.5 units to the left two times.

STEP 3 The result is -7.

This shows that 2 groups of -3.5 equals -7. STEP 4

So, -2 groups of -3.5 must equal the *opposite* of -7.

STEP 5 -2(-3.5) = 7

Check: Use the rules for multiplying rational numbers.

-2(-3.5) = 7

A negative times a negative equals a positive.

# YOUR TURN

**2.** Find -3(-1.25). \_\_\_\_\_

# Multiplying More Than Two Rational Numbers

If you multiply three or more rational numbers, you can use a pattern to find the sign of the product.

#### **EXAMPLE 3**

Multiply 
$$\left(-\frac{2}{3}\right)\left(-\frac{1}{2}\right)\left(-\frac{3}{5}\right)$$
.

STEP 2 
$$\left(-\frac{2}{3}\right)\left(-\frac{1}{2}\right) = +\left(\frac{2}{3}\cdot\frac{1}{2}\right)$$
  
=  $\frac{1}{3}$ 

Now, multiply the result, which is positive, by the third factor, which is negative. The product will be negative.

STEP 4 
$$\frac{1}{3} \left( -\frac{3}{5} \right) = \frac{1}{3} \left( -\frac{\cancel{3}}{5} \right)$$

#### Reflect

**3.** Look for a Pattern You know that the product of two negative numbers is positive, and the product of three negative numbers is negative. Write a rule for finding the sign of the product of *n* negative numbers.

Suppose you find the product of several rational numbers, one of which is zero. What can you say about the product?

Find each product.

**4.** 
$$\left(-\frac{3}{4}\right)\left(-\frac{4}{7}\right)\left(-\frac{2}{3}\right)$$

**5.** 
$$\left(-\frac{2}{3}\right)\left(-\frac{3}{4}\right)\left(\frac{4}{5}\right)$$

**6.** 
$$\left(\frac{2}{3}\right)\left(-\frac{9}{10}\right)\left(\frac{5}{6}\right)$$

### **Guided Practice**

Apply and extend previous understandings of multiplication and division and of fractions to multiply and divide rational numbers. Also 7.NS.2b, 7.NS.2c

How do you divide rational numbers?

# EXPLORE ACTIVITY (ACC) 7.NS.2b

# **Placement of Negative Signs in Quotients**

Quotients can have negative signs in different places.

Let p and q be rational numbers.

Quotients of Rational Numbers			
Sign of Dividend <i>p</i>	Sign of Divisor q	Sign of Quotient $\frac{p}{q}$	
+	_	_	
-	+	_	
+	+	+	
-	_	+	

Are the rational numbers  $\frac{12}{-4}$ , and  $-\left(\frac{12}{4}\right)$  equivalent?

Find each quotient. Then use the rules in the table to make sure the sign of the quotient is correct.

$$\frac{12}{4} =$$

$$\frac{-12}{4} =$$

$$\frac{12}{-4} = \underline{\qquad \qquad -\left(\frac{12}{4}\right)} = \underline{\qquad \qquad -\left(\frac{12}{4}\right)} = \underline{\qquad \qquad }$$

- **B** What do you notice about each quotient?
- C The rational numbers | are / are not | equivalent.

**D** Conjecture Explain how the placement of the negative sign in the rational number affects the sign of the quotients.

If p and q are rational numbers and q is not zero, what do you know about  $-\left(\frac{p}{q}\right), \frac{-p}{q}$ , and  $\frac{p}{-q}$ ?

#### **EXPLORE ACTIVITY** (cont'd)

#### Reflect

Write two equivalent quotients for each expression.

# **Quotients of Rational Numbers**

The rules for dividing rational numbers are the same as dividing integers.

#### **EXAMPLE 1**

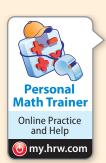

Over 5 months, Carlos wrote 5 checks for a total of \$323.75 to pay for his cable TV service. His cable bill is the same amount each month. What was the change in Carlos's bank account each month to pay for cable?

Find the quotient:  $\frac{-323.75}{5}$ 

- STEP 1 Use a negative number to represent the withdrawal from his account each month.
- **STEP 2** Find  $\frac{-323.75}{5}$ .
- STEP 3 Determine the sign of the quotient.

The quotient will be negative because the signs are different.

- STEP 4 Divide.  $\frac{-323.75}{5} = -64.75$ 
  - Carlos withdrew \$64.75 each month to pay for cable TV.

# YOUR TURN

Find each quotient.

3. 
$$\frac{2.8}{-4} =$$

**3.** 
$$\frac{2.8}{-4} =$$
 **4.**  $\frac{-6.64}{-0.4} =$  **5.**  $-\frac{5.5}{0.5} =$  **.**

**5.** 
$$-\frac{5.5}{0.5} =$$

**6.** A diver descended 42.56 feet in 11.2 minutes. What was the diver's average change in elevation per minute?

# **Complex Fractions**

A complex fraction is a fraction that has a fraction in its numerator, denominator, or both.

$$\frac{\frac{a}{b}}{\frac{c}{d}} = \frac{a}{b} \div \frac{c}{d}$$

### **EXAMPLE 2**

CA CC 7.NS.2c, 7.NS.3

STEP 1 Determine the sign of the quotient.

The quotient will be negative because the signs are different.

Write the complex fraction as division:  $\frac{10}{10} = \frac{7}{10} \div -\frac{1}{5}$ STEP 2

**STEP 3** Rewrite using multiplication:  $\frac{7}{10} \times \left(-\frac{5}{1}\right)$  Multiply by the reciprocal.

**STEP 4**)  $\frac{7}{10} \times \left(-\frac{5}{1}\right) = -\frac{35}{10}$  Multiply.  $\frac{\frac{7}{10}}{\frac{1}{1}} = -\frac{7}{2}$ 

Find  $\frac{\frac{3}{4}}{\frac{1}{4}}$ . STEP 1

STEP 2 Determine the sign of the quotient.

The quotient will be positive because the signs are the same.

Write the complex fraction as division:  $\frac{\frac{3}{4}}{\frac{1}{12}} = \frac{3}{4} \div \frac{1}{12}$ . STEP 3

**STEP 4** Rewrite using multiplication:  $\frac{3}{4} \times \frac{12}{1}$ . Multiply by the reciprocal.

STEP 5  $\frac{3}{4} \times \frac{12}{1} = \frac{36}{4} = 9$  Multiply. Simplify.  $\frac{\frac{3}{4}}{\frac{1}{1}} = 9$ 

Maya can fill 9 bags of trail mix.

- **26.** A hot air balloon descended 99.6 meters in 12 seconds. What was the balloon's average rate of descent in meters per second?

**27.** Sanderson is having trouble with his assignment. His shown work is as follows:

$$\frac{-\frac{3}{4}}{\frac{4}{3}} = -\frac{3}{4} \times \frac{4}{3} = -\frac{12}{12} = -1$$

However, his answer does not match the answer that his teacher gives him. What is Sanderson's mistake? Find the correct answer.

**28.** Science Beginning in 1996, a glacier lost an average of 3.7 meters of thickness each year. Find the total change in its thickness by the end of 2012.

#### FOCUS ON HIGHER ORDER THINKING

**29.** Represent Real-World Problems Describe a real-world situation that can be represented by the quotient  $-85 \div 15$ . Then find the quotient and explain what the quotient means in terms of the real-world situation.

**30.** Construct an Argument Divide 5 by 4. Is your answer a rational number? Explain.

**31. Critical Thinking** Should the quotient of an integer divided by a nonzero integer always be a rational number? Why or why not?

# 3.6 Number Operations

Solve ... problems ... with positive and negative rational numbers in any form ... using tools strategically. (For the full text of the standard, see the table at the front of the book beginning on page CA2.) Also 7.NS.3

How do you use different forms of rational numbers and strategically choose tools to solve problems?

# **Assessing Reasonableness of Answers**

Even when you understand how to solve a problem, you might make a careless solving error. You should always check your answer to make sure that it is reasonable.

**EXAMPLE** 1

Jon is hanging a picture. He wants to center it horizontally on the wall. The picture is  $32\frac{1}{2}$  inches long, and the wall is  $120\frac{3}{4}$  inches long. How far from each edge of the wall should he place the picture?

STEP 1

Find the total length of the wall not covered by the picture.

$$120\frac{3}{4} - 32\frac{1}{2} = 88\frac{1}{4}$$
 in.

Subtract the whole number  $120\frac{3}{4} - 32\frac{1}{2} = 88\frac{1}{4}$  in. parts and then the fractional

STEP 2

Find the length of the wall on each side of the picture.

$$\frac{1}{2}$$
  $\left(88\frac{1}{4}\right) = 44\frac{1}{8}$  in.

Jon should place the picture 44  $\frac{1}{8}$  inches from each edge

Check the answer for reasonableness.

The wall is about 120 inches long. The picture is about 30 inches long. The length of wall space left for both sides of the picture is about 120 - 30 = 90 inches. The length left for each side is about  $\frac{1}{2}$ (90) = 45 inches.

The answer is reasonable because it is close to the estimate.

 $120\frac{3}{4}$  in.

# YOUR TURN

**1.** A 30-minute TV program consists of three commercials, each  $2\frac{1}{2}$  minutes long, and four equal-length entertainment segments. How long is each

entertainment segment? \_\_\_\_\_

My Notes

You have solved problems using integers, positive and negative fractions, and positive and negative decimals. A single problem may involve rational numbers in two or more of those forms.

**Using Rational Numbers in Any Form** 

#### **EXAMPLE 2**

Alana uses  $1\frac{1}{4}$  cups of flour for each batch of blueberry muffins she makes. She has a 5-pound bag of flour that cost \$4.49 and contains seventy-six  $\frac{1}{4}$ -cup servings. How many batches can Alana make if she uses all the flour? How much does the flour for one batch cost?

#### **Analyze Information**

Identify the important information.

- Each batch uses 1<sup>1</sup>/<sub>4</sub> cups of flour.
   Seventy-six <sup>1</sup>/<sub>4</sub> -cup servings of flour cost \$4.49.

#### **Formulate a Plan**

Use logical reasoning to solve the problem. Find the number of cups of flour that Alana has. Use that information to find the number of batches she can make. Use that information to find the cost of flour for each batch.

#### Solve

Number of cups of flour in bag:

$$76 \times \frac{1}{4}$$
 cup per serving = 19 cups

Number of batches Alana can make:

total cups of flour 
$$\div \frac{\text{cups of flour}}{\text{batch}} = 19 \text{ cups } \div \frac{1.25 \text{ cups}}{1 \text{ batch}}$$
  
= 19  $\div$  1.25  
= 15.2

Alana cannot make 0.2 batch. The recipe calls for one egg, and she cannot divide one egg into tenths. So, she can make 15 batches.

Cost of flour for each batch:  $$4.49 \div 15 = $0.299$ , or about \$0.30.

#### **Justify and Evaluate**

A bag contains about 80 quarter cups, or about 20 cups. Each batch uses about 1 cup of flour, so there is enough flour for about 20 batches. A bag costs about \$5.00, so the flour for each batch costs about \$5.00  $\div$  20 = \$0.25. The answers are close to the estimates, so the answers are reasonable.

# YOUR TURN

**2.** A 4-pound bag of sugar contains 454 one-teaspoon servings and costs \$3.49. A batch of muffins uses  $\frac{3}{4}$  cup of sugar. How many batches can you make if you use all the sugar? What is the cost of sugar for each

batch? (1 cup = 48 teaspoons)

# **Using Tools Strategically**

A wide variety of tools are available to help you solve problems. Rulers, models, calculators, protractors, and software are some of the tools you can use in addition to paper and pencil. Choosing tools wisely can help you solve problems and increase your understanding of mathematical concepts.

#### **EXAMPLE 3**

The depth of Golden Trout Lake has been decreasing in recent years. Two years ago, the depth of the lake was 186.73 meters. Since then the depth has been changing at an average rate of  $-1\frac{3}{4}\%$  per year. What is the depth of the lake today?

STEP 1

Convert the percent to a decimal.

$$-1\frac{3}{4}\% = -1.75\%$$
 Write the fraction as a decimal.  
=  $-0.0175$  Move the decimal point two places left.

STEP 2

Find the depth of the lake after one year. Use a calculator to simplify the computations.

$$186.73 \times (-0.0175) \approx -3.27$$
 meters Find the change in depth.

$$186.73 - 3.27 = 183.46 \ \text{meters} \qquad \qquad \textbf{Find the new depth}.$$

STEP 3

Find the depth of the lake after two years.

$$183.46 \times (-0.0175) \approx -3.21$$
 meters Find the change in depth.

$$183.46 - 3.21 = 180.25$$
 meters Find the new depth.

STEP 4

Check the answer for reasonableness.

The original depth was about 190 meters. The depth changed by about -2% per year. Because (-0.02)(190) = -3.8, the depth changed by about -4 meters per year or about -8 meters over two years. So, the new depth was about 182 meters. The answer is close to the estimate, so it is reasonable.

How could you write a single expression for calculating the depth after 1 year? after 2 years?

# YOUR TURN

**3.** Three years ago, Jolene bought \$750 worth of stock in a software company. Since then the value of her purchase has been increasing at an average rate

of  $12\frac{3}{5}$ % per year. How much is the stock worth now? \_\_\_\_\_

#### **Guided Practice**

**1.** Mike hiked to Big Bear Lake in 4.5 hours at an average rate of  $3\frac{1}{5}$  miles per hour. Pedro hiked the same distance at a rate of  $3\frac{3}{5}$  miles per hour. How long did it take Pedro to reach the lake? (Example 1 and Example 2)

**STEP 1** Find the distance Mike hiked.

4.5 h  $\times$  miles per hour = miles

**STEP 2** Find Pedro's time to hike the same distance.

miles ÷ miles per hour = hours

2. Until this year, Greenville had averaged 25.68 inches of rainfall per year for more than a century. This year's total rainfall showed a change of  $-2\frac{3}{8}\%$  with respect to the previous average. How much rain fell this year? (Example 3)

Use a calculator to find this year's decrease to the nearest hundredth.

 $\boxed{\qquad \qquad } \mathsf{inches} \times \boxed{\qquad } \approx \boxed{\qquad } \mathsf{inches}$ 

- ESSENTIAL QUESTION CHECK-IN
  - **3.** Why is it important to consider using tools when you are solving a problem?

#### Solve, using appropriate tools.

**4.** Three rock climbers started a climb with each person carrying 7.8 kilograms of climbing equipment. A fourth climber with no equipment joined the group. The group divided the total weight of climbing equipment equally among the four climbers. How much

did each climber carry? \_\_\_

**5.** Foster is centering a photo that is  $3\frac{1}{2}$  inches wide on a scrapbook page that is 12 inches wide. How far from each side of the page

should he put the picture? \_

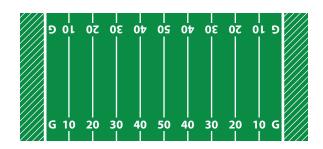

**6.** Diane serves breakfast to two groups of children at a daycare center. One box of Oaties contains 12 cups of cereal. She needs  $\frac{1}{3}$  cup for each younger child and  $\frac{3}{4}$  cup for each older child. Today's group includes 11 younger children and 10 older children. Is one box of Oaties enough for everyone?

Explain.

7. The figure shows how the yard lines on a football field are numbered. The goal lines are labeled G. A referee was standing on a certain yard line as the first quarter ended. He walked  $41\frac{3}{4}$  yards to a yard line with the same number as the one he had just left. How far was the referee from the nearest goal

line?

In 8–10, a teacher gave a test with 50 questions, each worth the same number of points. Donovan got 39 out of 50 questions right. Marci's score was 10 percentage points higher than Donovan's.

8. What was Marci's score? Explain.

**9.** How many more questions did Marci answer correctly? Explain.

**10.** Explain how you can check your answers for reasonableness.

# For 11–13, use the expression 1.43 $imes \left(-\frac{19}{37}\right)$ .

- **11. Critique Reasoning** Jamie says the value of the expression is close to -0.75. Does Jamie's estimate seem reasonable? Explain.
- **12.** Find the product. Explain your method.
- **13.** Does your answer to Exercise 12 justify your answer to Exercise 11?

#### **FOCUS ON HIGHER ORDER THINKING**

**14.** Persevere in Problem Solving A scuba diver dove from the surface of the ocean to an elevation of  $-79\frac{9}{10}$  feet at a rate of -18.8 feet per minute. After spending 12.75 minutes at that elevation, the diver ascended to an elevation of  $-28\frac{9}{10}$  feet. The total time for the dive so far was  $19\frac{1}{8}$  minutes. What was

the rate of change in the diver's elevation during the ascent? \_\_\_\_\_

**15.** Analyze Relationships Describe two ways you could evaluate 37% of the sum of  $27\frac{3}{5}$  and 15.9. Tell which method you would use and why.

**16.** Represent Real-World Problems Describe a real-world problem you could solve with the help of a yardstick and a calculator.
