## Understand Place Value

## Think It Through

## What exactly does place value mean?

Place value is the value of a digit, or amount the digit is worth, based on its position in a number. You can use a place-value chart to help understand the value of each digit. The chart below shows the number 27,138.

| Hundred Thousands | Ten Thousands | Thousands | Hundreds | Tens | Ones |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | 2 | 7 | 1 | 3 | 8 |

The 2 has a value of 2 ten-thousands, or 20,000.
The 7 has a value of 7 thousands, or 7,000 .
The 1 has a value of 1 hundred, or 100 .
The 3 has a value of 3 tens, or 30 .
The 8 has a value of 8 ones, or 8 .

## Think How are place values related to one another?

Our number system is based on a pattern of tens. A digit in any place has 10 times the value it would have in the place to its right.

| Hundred Thousands | Ten Thousands | Thousands | Hundreds | Tens | Ones |
| :--- | :---: | :---: | :---: | :---: | :---: |
|  |  | 3 | 3 | 3 | 3 |

The 3 in the tens place has a value of 30 .
That is 10 times the value of the 3 in the ones place. $30=10 \times 3$
Circle the digit in the table that has a value of 30 .
The 3 in the hundreds place has a value of 300 .
That is 10 times the value of the 3 in the tens place. $300=10 \times 30$
The 3 in the thousands place has a value of 3,000 .
That is 10 times the value of the 3 in the hundreds place. $3,000=10 \times 300$

## Think How can a place-value chart help you think about numbers?

The digits in numbers are in groups of three places called periods. Commas are used to separate the periods.

To read numbers with four or more digits you need to know how to read three-digit numbers and the names of the periods. How do you read 467,882?

A place-value chart can help you read and write numbers.

| Thousands Period |  |  | Ones Period |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Hundred Thousands | Ten Thousands | Thousands | Hundreds | Tens | Ones |
| 4 | 6 | 7 | 8 | 8 | 2 |

To read 467,882 , start at the left and read to the comma. Then say the name of the period.

## four hundred sixty-seven thousand

Then read the three-digit number in the ones period. Do not say the name of the ones period.

## eight hundred eighty-two

Here is the number in word form.

## four hundred sixty-seven thousand, eight hundred eighty-two

Standard form is the way you usually see a number written, using digits.
467,882
Expanded form is a way to write a number to show the place value of each digit.

$$
400,000+60,000+7,000+800+80+2
$$

## Reflect

1 Compare the values of the two $8 s$ in the number 467,882 .

## Think About Place Value

## Let's Explore the Idea Use the place-value chart to

 help you think about the value of each digit.

| Hundred Thousands | Ten Thousands | Thousands | Hundreds | Tens | Ones |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | 2 | 5 | 0 | 4 | 9 |

2 Write the number in expanded form.

3 Write the number in word form.

4 What digit is in the thousands place?
5 What is the value of the digit in the thousands place?
6 What would be the value of the digit from problem 4 if it were in the hundreds place? $\qquad$

Now try these two problems.
7 Find the next two numbers in the following pattern.

$$
600,000 \text { 60,000 6,000 } 600
$$

$\qquad$
8 Write the numbers from the pattern in problem 7 in the following place-value chart. The first one is done for you.

| Hundred Thousands | Ten Thousands | Thousands | Hundreds | Tens | Ones |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 6 | 0 | 0 | 0 | 0 | 0 |
|  |  |  |  |  |  |
|  |  |  |  |  |  |
|  |  |  |  |  |  |
|  |  |  |  |  |  |
|  |  |  |  |  |  |

## Let's Talk About lt

Solve the problems below as a group.

9 Look at the numbers in problem 8 on the previous page. What is the same about all of the numbers?
$\qquad$
$\qquad$
What is different about all of the numbers?
$\qquad$
$\qquad$
10 Complete the following to show different ways you can make 2,079.
$2,079=$ $\qquad$ thousands + $\qquad$ hundreds + $\qquad$ tens + $\qquad$ ones
$2,079=$ $\qquad$ hundreds + $\qquad$ tens + $\qquad$ ones
$2,079=$ $\qquad$ tens + $\qquad$ ones $2,079=$ $\qquad$ ones

11 Solve the following base-ten riddles. Show your work.

- I have 18 ones, 15 hundreds, 15 tens, and 8 thousands.

What number am I? $\qquad$

- I have 14 tens, 6 hundreds, 7 ten-thousands, and 15 ones.

What number am I? $\qquad$

## Try It Another Way

12 What number is ten thousand less than 842,719 ?
13 What number is one thousand more than 700,012 ? $\qquad$

## Connect Ideas About Place Value

Talk through these problems as a class, then write your answers below.
14 Explain Emma wrote thirty-six thousand, forty-two as 3,642. Explain what she did wrong. Then write the number correctly.
$\qquad$
$\qquad$
$\qquad$
$\qquad$

15 Demonstrate Suppose you only have hundreds, tens, and ones blocks. What are two different ways you could make the number 1,718?
$\qquad$
$\qquad$
$\qquad$
$\qquad$

16 Apply Place value is important to know when you are talking about prices. What items have prices that are in the hundreds of dollars? thousands of dollars? tens of thousands of dollars? Think about the prices of items with place values in the hundreds, thousands, and ten-thousands. Give at least two examples of each.

Hundreds Place: $\qquad$
Thousands Place: $\qquad$
Ten-Thousands Place: $\qquad$

## Apply Ideas About Place Value

17 Put lt Together Use what you have learned to complete this task.

You are playing a game that includes the following cards.

Part A Choose six cards. Circle the cards you choose.
i Make the greatest number possible using each of the six cards only once. Write your answer in standard form and in expanded form.

Standard Form: $\qquad$
Expanded Form: $\qquad$
ii Make the least number possible using the same six cards. If the 0 card is one of your cards, do not use it as the first digit in your number. Write your answer in standard form and in expanded form.

Standard Form: $\qquad$
Expanded Form: $\qquad$
Part B Look at the standard form of your answers to Part A. Circle a digit that you used in both numbers. Did the value of the digit change between the two numbers? Explain why or why not.
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
